Description

Project Overview:

This project aims to redesign the existing website to create a modern, user-friendly, and information-rich online platform that caters to the diverse needs of today's travelers. The new website will prioritize ease of use, efficiency, and a visually appealing design, ultimately enhancing the customer experience and driving brand loyalty.

Project Objectives:

- **Enhance user experience:**
  - Create a user-friendly interface that is intuitive and easy to navigate for all users, regardless of their technical expertise.
  - Implement responsive design principles to ensure optimal viewing and functionality across various devices
- **Optimize booking process:**
  - Streamline the flight search and booking process, making it faster and more efficient for users to find and purchase flights.
- **Improve information accessibility:**
  - Integrate a user-friendly search function to allow users to easily find the information they need.

Technologies

Front-End Technologies:

- **HTML** (HyperText Markup Language): Which forms the basic structure and content of the website.
- **CSS** (Cascading Style Sheets): Which defines the visual style of the website, including layout, colors, fonts, and animations.
- **JavaScript**: Which adds interactivity and dynamic elements to the website, such as search functionality, drop-down menus, and image carousels.

Frame Works

Front-End Frameworks:

- **Bootstrap:** Offers a vast library of pre-built, responsive components (buttons, forms, navigation bars) and utilities (grid system, styling tools) built on top of HTML, CSS, and JavaScript. This speeds up development and ensures consistent design across the website while promoting responsiveness for various devices.
